Chapter 1

Pairs

1.1 Unordered, Ordered Pairs

Notion. *Summary*
Sets define ordered and unordered pairs. Ordered pairs contain coordinates. Coordinates define equivalent.

Definition. Unordered Pair
$\{a, b\}$ is a set whose elements are exactly a and b.

Definition. Ordered Pair
Ordered pair of a and b is denoted by (a, b).

Definition. Coordinate
a is the first coordinate of the pair, b is the second coordinate.

Definition.
$(a, b) = \{\{a\}, \{a, b\}\}$.

Definition.
For two different sets α and β, $(a, b) = \{\{a, \alpha\}, \{b, \beta\}\}$.

Note. *An alternative definition of ordered pairs.*

Theorem 1.1.1.
$(a, b) = (a', b')$ if and only if $a = a'$ and $b = b'$.

Proof. Obviously. □

Proposition 1.1.1.1.
Two ***ordered pairs*** are ***equal*** if and only if their ***first coordinates*** are equal and their ***second coordinates*** are equal.

Proof. Obviously. □

Note. *Ordered pair should be defined in such a way that two ordered pairs are equal if and only if their first coordinates are equal and their second coordinates are equal.*

Proposition 1.1.1.2.
$(a, b) \neq (b, a)$ if $a \neq b$.

Proof. Obviously. □

Proposition 1.1.1.3.
If $a \neq b$, (a, b) has two elements, a ***singleton*** $\{a\}$ and an ***unordered pair*** $\{a, b\}$. We find the ***first coordinate*** by looking at the element of $\{a\}$. The ***second coordinate*** is then the other element of $\{a, b\}$. If $a = b$, then $(a, a) = \{\{a\}\}$ has only one element.

Proof. Obviously. □

Note. *If $a \neq b$, (a, b) has two elements, a singleton $\{a\}$ and an unordered pair $\{a, b\}$. The first coordinate is the element of $\{a\}$; the second coordinate is the other element of $\{a, b\}$.*

Definition. One-Tuples
$(a) = a$.

Definition. Ordered Triples
$(a, b, c) = ((a, b), c)$.

Definition. Ordered Quadruples
$(a, b, c, d) = (((a, b), c), d)$.

Property 1.1.1.
$(a, b) \in \mathcal{P}(\mathcal{P}(\{a, b\}))$. More generally, if $a \in A$ and $b \in A$, then $(a, b) \in \mathcal{P}(\mathcal{P}(\{a, b\}))$.

Proof. Obviously. □

Property 1.1.2.
$a,\ b \in \bigcup(a, b)$.

Proof. Obviously. □

Property 1.1.3.
(a, b), (a, b, c), and (a, b, c, d) exist for all a, b, c, and d.

Proof. Obviously. □

Property 1.1.4.
If $(a, b) = (b, a)$, then $a = b$.

Proof. Obviously. □

Property 1.1.5.
$(a, b, c) = (a', b', c')$ implies $a = a'$, $b = b'$, and $c = c'$. $(a, b, c, d) = (a', b', c', d')$ implies $a = a'$, $b = b'$, $c = c'$, and $d = d'$.

Proof. Obviously. □

1.2 Relation

Notion. *Summary*
Undering.

Definition. Binary Relation
A set A is a binary relation if all elements of R are ordered pairs, i.e., if for any $z \in R$ there exist x and y such that $z = (x, y)$. A binary relation A is in A if and only if $R \subseteq A^2$

Note. *Relations between objects of two sorts called binary relations.*

Note. *A binary relation is determined by specifying all ordered pairs of objects in that relation; it does not matter by what property the set of these ordered pairs is described.*

Definition. Inverse
Let R be a binary relation. The inverse of R is the set

$$R^{-1} = \{\, z \mid z = (x, y) \wedge \exists\, x, y \left((y, x) \in R\right) \}.$$

Definition. Domain
Let A be a binary relation. The set of all x which are in relation A with some y is called the domain of R and denoted by $\operatorname{dom} R$.

Note. $\operatorname{dom} R$ *is the set of all first coordinates of ordered pairs in* R.

Definition. Range
Let A be a binary relation. The set of all y such that, for some x, x is in relation R with y is called the range of A, denoted by $\operatorname{ran} R$.

Note. $\operatorname{ran} R$ *is the set of all second coordinates of ordered pairs in* R.

Definition. Field
Let A be a binary relation. The set $\operatorname{dom} R \cup \operatorname{ran} R$ is called the field of R and is denoted by $\operatorname{field} R$. If $\operatorname{field} R \subseteq X$, we say that R is a relation in X or that R is a relation between elements of X.

Proposition 1.2.0.1.
Both $\operatorname{dom} R$ and $\operatorname{ran} R$ *exist* for any relation R.

Proof. Obviously. □

Definition. Image
The image of A under R is the set of all y from the range of R related in R to some element of A; it is denoted by $R[A]$.

Definition. Inverse Image
The inverse image of B under R is the set of all x from the domain of R related in R to some element of B; it is denoted by $R^{-1}[A]$.

Proposition 1.2.0.2.
$\operatorname{dom} R = \operatorname{ran} R^{-1}$.

Proof. Obviously □

Proposition 1.2.0.3.
The *inverse image of B under R* is equal to the *image of B under R^{-1}*.

Proof. Obviously □

Definition. Composition
Let R and S be binary relations. The composition of R and S is the relation.

$$S \circ R = \{\, (x,z) \mid \exists y \left((x,y) \in R \wedge (y,z) \in S\right) \}.$$

Note. *$(x,z) \in S \circ R$ means that for some y, $(x,y) \in R$ and $(y,z) \in S$.*

Definition. Cartesian Product
Let A and B be sets. The set of all ordered pairs whose first coordinate is from A and whose second coordinate is from B is called the cartesian product of A and B and denoted $A \times B$.

Note. *$A \times B$ is a relation in which every element of A is related to every element of B.*

Proposition 1.2.0.4.
$A \times B$ *exists*.

Proof. $A \times B = \{\, w \in \mathcal{P}(\mathcal{P}(\{a,b\})) \mid w = (a,b) \wedge \exists a, b \left(a \in A \wedge b \in B\right) \}$. □

Proposition 1.2.0.5.
$(A \times B) \times C = A \times B \times C$.

Proof. Obviously. □

Note. $A \times B \times C = \{ (a, b, c) \mid a \in A \wedge b \in B \wedge c \in C \}$.

Definition. Unary Relation
A unary relation is any set. A unary relation in A is any subset of A.

Definition. Ternary Relation
A ternary relation is a set of unordered triples. More explicitly, S is a ternary relation if for every $u \in S$, there exist x, y, and z such that $u = (x, y, z)$. If $S \subseteq A^3$, we say that S is a ternary relation in A.

Definition. Membership Relation
The membership relation on A is defined by

$$\in_A = \{ (a, b) \mid a, b \in A \wedge a \in b \}.$$

Definition. Identity Relation
The identity relation on A is defined by

$$Id_A = \{ (a, b) \mid a, b \in A \wedge a = b \}.$$
