Chapter 1

Pairs

1.1 Unordered, Ordered Pairs

Notion. Summary

Set Derivations: Ordered and Unordered Pairs.

Set Structures: Coordinates.

Coordinate Derications: Equivalent of Sets.

Definition. Unordered Pair

 $\{a,b\}$ is a set whose elements are exactly a and b.

Definition. Ordered Pair

Ordered pair of a and b is denoted by (a, b).

Definition. Coordinate

a is the first coordinate of the pair, b is the second coordinate.

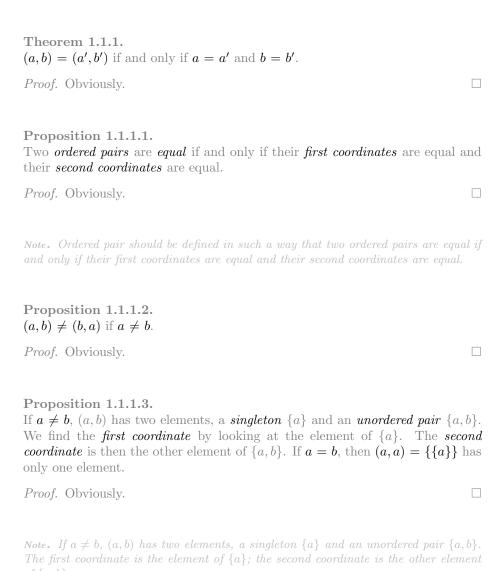

Definition.

$$(a,b) = \{\{a\}, \{a,b\}\}.$$

Definition.

For two different sets α and β , $(a,b) = \{\{a,\alpha\}, \{b,\beta\}\}.$

Note. An alternative definition of ordered pairs.

Definition. One-Tuples (a) = a.

Definition. Ordered Triples (a, b, c) = ((a, b), c).

1.2. RELATION 7

Definition. Ordered Quadruples

(a, b, c, d) = (((a, b), c), d).Property 1.1.1. $(a,b) \in \mathcal{P}(\mathcal{P}(\{a,b\}))$. More generally, if $a \in A$ and $b \in A$, then $(a,b) \in \mathcal{P}(\mathcal{P}(\{a,b\}))$. *Proof.* Obviously. Property 1.1.2. $a, b \in \bigcup (a, b).$ Proof. Obviously. Property 1.1.3. (a,b), (a,b,c), and (a,b,c,d) exist for all a,b,c, and d. Proof. Obviously. Property 1.1.4. If (a, b) = (b, a), then a = b. *Proof.* Obviously. Property 1.1.5. (a, b, c) = (a', b', c') implies a = a', b = b', and c = c'. (a, b, c, d) = (a', b', c', d')implies a = a', b = b', c = c', and d = d'. Proof. Obviously.

1.2 Relation

 $oldsymbol{Notion.}$ Summary

Binary Relation Structures: Domain, Range, Field, Image.

Binary Relation Operators: Inverse, Composition, Cartesian Product, Binary Relation Instances: Membership Relation, Identity Relation. Binary Relation Generalizations: Unary Relation, Ternary Relation.

Definition. Binary Relation

A set A is a binary relation if all elements of R are ordered pairs, i.e., if for any $z \in R$ there exist x and y such that z = (x, y). A binary relation A is in A if and only if $R \subseteq A^2$

Note. Relations between objects of two sorts called binary relations.

Note. A binary relation is determined by specifying all ordered pairs of objects in that relation; it does not matter by what property the set of these ordered pairs is described.

Definition. Domain

Let A be a binary relation. The set of all x which are in relation A with some y is called the domain of R and denoted by dom R.

Note. dom R is the set of all first coordinates of ordered pairs in R.

Definition. Range

Let A be a binary relation. The set of all y such that, for some x, x is in relation R with y is called the range of A, denoted by ran R.

Note. ran R is the set of all second coordinates of ordered pairs in R.

Definition. Field

Let A be a binary relation. The set $\operatorname{dom} R \cup \operatorname{ran} R$ is called the field of R and is denoted by field R. If field $R \subseteq X$, we say that R is a relation in X or that R is a relation between elements of X.

Proposition 1.2.0.1.

Both $\operatorname{dom} R$ and $\operatorname{ran} R$ exist for any relation R.

Proof. Obviously.

Definition. Image

The image of A under R is the set of all y from the range of R related in R to some element of A; it is denoted by R[A].

1.2. RELATION 9

Definition. Inverse Image

The inverse image of B under R is the set of all x from the domain of R related in R to some element of B; it is denoted by $R^{-1}[A]$.

Proposition 1.2.0.2.

 $dom R = ran R^{-1}.$

Proof. Obviously

Proposition 1.2.0.3.

The inverse image of B under R is equal to the image of B under R^{-1} .

Proof. Obviously

Definition. Inverse

Let R be a binary relation. The inverse of R is the set

$$R^{-1} = \{ z \mid z = (x, y) \land \exists x, y ((y, x) \in R) \}.$$

Definition. Composition

Let R and S be binary relations. The composition of R and S is the relation.

$$S \circ R = \{ (x, z) \mid \exists y ((x, y) \in R \land (y, z) \in S) \}.$$

Note. $(x,z) \in S \circ R$ means that for some $y, (x,y) \in R$ and $(y,z) \in S$.

Definition. Cartesian Product

Let A and B be sets. The set of all ordered pairs whose first coordinate is from A and whose second coordinate is from B is called the cartesian product of A and B and denoted $A \times B$.

Note. $A \times B$ is a relation in which every element of A is related to every element of B.

Proposition 1.2.0.4.

 $A \times B$ exists.

Proof.
$$A \times B = \{ w \in \mathcal{P}(\mathcal{P}(\{a,b\})) \mid w = (a,b) \land \exists a,b (a \in A \land b \in B) \}.$$

Proposition 1.2.0.5.

$$(A \times B) \times C = A \times B \times C.$$

Note. $A \times B \times C = \{ (a, b, c) \mid a \in A \land b \in B \land c \in C \}.$

Definition. Unary Relation

A unary relation is any set. A unary relation in A is any subset of A.

Definition. Ternary Relation

A ternary relation is a set of unordered triples. More explicitly, S is a ternary relation if for every $u \in S$, there exist x, y, and z such that u = (x, y, z). If $S \subseteq A^3$, we say that S is a ternary relation in A.

Definition. Membership Relation

The membership relation on A is defined by

$$\in_A = \{ (a, b) \mid a, b \in A \land a \in b \}.$$

Definition. Identity Relation

The identity relation on A is defined by

$$Id_A = \{ (a, b) \mid a, b \in A \land a = b \}.$$

Property 1.2.1.

Let A be a binary relation. dom R and ran R exist.

Proof.
$$(x,y) \in R$$
 implies $x,y \in \bigcup(\bigcup R)$.

Remark. Union flatten a set. Powerset structure a set.

Property 1.2.2.

 R^{-1} exist.

1.2. RELATION

11

Proof. $R^{-1} \subseteq \operatorname{dom} R \times \operatorname{ran} R$.

Property 1.2.3.

 $S \circ R$ exist.

Proof. $S \circ R \subseteq \text{dom } R \times \text{ran } S$.

Property 1.2.4.

For any three binary relations R, S, and T, $T \circ (S \circ R) = (T \circ S) \circ R$.

Proof. $S \circ R \subseteq \text{dom } R \times \text{ran } S$.

Property 1.2.5.

 $A \times B \times C$ exist.

Proof. Obviously.

Ш

Property 1.2.6.

Let R be a binary relation and A and B sets.

- 1. $R[A \cup B] = R[A] \cup R[B]$
- 2. $R[A \cap B] \subseteq R[A] \cap R[B]$
- $3. R[A-B] \supseteq R[A] R[B]$
- 4. $R^{-1}[A \cup B] = R^{-1}[A] \cup R^{-1}[B]$
- 5. $R^{-1}[A \cap B] \subseteq R^{-1}[A] \cap R^{-1}[B]$
- 6. $R^{-1}[A-B] \supseteq R^{-1}[A] R^{-1}[B]$
- 7. $R^{-1}[A B] \supseteq R^{-1}[A] R^{-1}[B]$
- 8. $R^{-1}[R[A]] \supseteq A \cap \operatorname{dom} R$
- 9. $R[R^{-1}[B]] \supseteq B \cap \operatorname{ran} R$

Proof. Obviously.

Property 1.2.7.

Let $R \subseteq X \times Y$.

1. $R[X] = \operatorname{ran} R$.

2.
$$R^{-1}[X] = \text{dom } R$$
.

3. If
$$a \notin \text{dom } R$$
, $R[\{a\}] = \emptyset$.

4. If
$$b \notin \operatorname{ran} R$$
, $R^{-1}[\{b\}] = \emptyset$.

5. dom
$$R = ran R^{-1}$$
.

6.
$$ran R = dom R^{-1}$$
.

7.
$$(R^{-1})^{-1} = R$$
.

8.
$$R^{-1} \circ R \supseteq \operatorname{Id}_{\operatorname{dom} R}$$

9.
$$R \circ R^{-1} \supseteq \operatorname{Id}_{\operatorname{ran} R}$$
.

Proof. Obviously.

Property 1.2.8.

1.
$$A \times B = \emptyset$$
 if and only if $A = \emptyset$ or $B = \emptyset$.

2.
$$(A_1 \cup A_2) \times B = (A_1 \times B) \cup (A_2 \times B)$$
.

3.
$$(A_1 \cap A_2) \times B = (A_1 \times B) \cap (A_2 \times B)$$
.

4.
$$(A_1 - A_2) \times B = (A_1 \times B) - (A_2 \times B)$$
.

5.
$$(A_1 \triangle A_2) \times B = (A_1 \times B) \triangle (A_2 \times B)$$
.

Proof. Obviously.
