Chapter 1

Pairs

1.1 Function

Notion. *Summary*
Function Structures: Domain, Range, Restriction, Extension.
Function Operators: Equivalent, Inverse, Composition.
Function Instances: Injective, Invertable, Compatible.
Function Generalizations: Index System of Sets.

Definition. Function
A binary relation F is a function if and only if for every a from dom F there is exactly one b such that aFb. This unique b is called the value of F at a. $F(a)$ is not defined if $a \notin domainF$.

Note. *A binary relation F is called a* function *(or* mapping, correspondence*) if aFb_1* and aFb_2 *imply* $b_1 = b_2$ *for any a, b_1, and b_2.*

Note. Function *is a* procedure, *a* rule, assigning to any object a from the domain of the function a unique object b, the value of the function at a.

Note. *A* function *represents a special type of* relation, *a relation where every* object a from the domain *is related to precisely* one object in the range, *namely, to the value of the function at a.*

5

Proposition 1.1.1.
Let F and G be functions. $F = G$ if and only if $\operatorname{dom} F = \operatorname{dom} G$ and $F(x) = G(x)$ for all $x \in \operatorname{dom} F$.

Proof. The Axiom of Extensionality.   □

Definition.
Let F be a function and A and B sets.

1. F is a function on A if $\operatorname{dom} F = A$.

2. F is a function into B if $\operatorname{ran} F \subseteq B$.

3. F is a function onto B if $\operatorname{ran} F = B$.

4. The restriction of the function F to A is the function $F \restriction A = \{\, (a,b) \in F \mid a \in A \,\}$.

5. If G is a restriction of F to some A, we say that F is an extension of G.

Note. *Concepts of domain, range, image, inverse image, inverse, and composition can be applied to functions.*

Proposition 1.1.2.
Let f and g be functions. Then $g{\circ}f$ *is a function*, $g{\circ}f$ *is defined at x if and only if f is defined at x and g is defined at $f(x)$.*

1. $\operatorname{dom}(g{\circ}f) = \operatorname{dom} f \cap f^{-1}[\operatorname{dom} g]$.

2. $(g{\circ}f)(x) = g(f(x))$ *for all $x \in \operatorname{dom}(g{\circ}f)$.*

Proof. Obviously.   □

Definition. Invertiable
A function f is invertible if f^{-1} is a function.

Proposition 1.1.3.
If f is a function, its *inverse* f^{-1} is a *relation*, but it may not be a function.

Proof. Obviously.   □

Definition.
A function f is called one-to-one or injective if $a_1 \in \mathrm{dom}\, f$, $a_2 \in \mathrm{dom}\, f$, and $a_1 \neq a_2$ implies $f(a_1) \neq f(a_2)$. In other words if $a_1 \in \mathrm{dom}\, f$, $a_2 \in \mathrm{dom}\, f$, and $f(a_1) = f(a_2)$ implies $a_1 = a_2$.

Note. *A one-to-one function attains different values for different elements from its domain.*

Proposition 1.1.4.
A function is *invertible* if and only if it is *one-to-one*.

Proof. Let f be invertible; then f^{-1} is a function. □

Proposition 1.1.5.
If f *is invertible*, then f^{-1} *is also invertible*.

Proof. $\left(f^{-1}\right)^{-1} = f$. □

Definition.
Function f and g are called compatible if $f(x) = g(x)$ for all $x \in \mathrm{dom}\, f \cap \mathrm{dom}\, g$.

Definition.
A set of functions F is called a compatible system of functions if any two functions f and g from F are compatible.

Proposition 1.1.6.
Functions f and g are compatible if and only if $f \cup g$ is a function. Functions f and g are compatible if and only if $f \upharpoonright (\mathrm{dom}\, f \cap \mathrm{dom}\, g) = g \upharpoonright (\mathrm{dom}\, f \cap \mathrm{dom}\, g)$.

Proof. Obviously. □

Theorem 1.1.1.
If F is a *compatible system of functions*, the $\bigcup F$ is a function with $\mathrm{dom}(\bigcup F) = \bigcup \{ \mathrm{dom}\, f \mid f \in F \}$. The function $\bigcup F$ *extends* all $f \in F$.

Proof. Obviously. □

Definition.
Let A and B be sets. The set of all functions on A into B is denoted B^A.

Proposition 1.1.7.
B^A *exists.*

Proof. $B^A \subseteq \mathcal{P}(A \times B)$. □

Definition.   Indexed System of Sets
Let $S = \langle\, S_i \mid i \in I \,\rangle$ be a function with domain I, the values S_i are arbitrary sets. We call the function $\langle\, S_i \mid i \in I \,\rangle$ an indexed system of sets, whenever we wish to stress that the values of S are sets.

Definition.   Product of the Indexed System
Let $S = \langle\, S_i \mid i \in I \,\rangle$ and f be a function on I. $\prod S = \{\, f \mid \forall\, i \in I \left(f_i \in S_i \right) \,\}$

Proposition 1.1.8.
$\prod_{i \in I} S_i$ *exists.*

Proof. $\prod_{i \in I} S_i \subseteq \mathcal{P}((I \times \bigcup_{i \in I} S_i))$ □
